NUMBERS

ATTACH

Excel

Sheets

A spreadsheet you inherited. What every column does, and where the totals do not match.

Explain what this worksheet does for someone who did not build it: what each column means, which cells are inputs and which are calculated. Then list anything inconsistent: mixed formats, totals that do not match their ranges, hard-coded numbers. Change nothing.

Attach the workbook itself, every tab. The tab nobody opens is usually where the problem is.

What comes back.

What the sheet does, in plain words. Then four places it does not add up.

WHAT IT DOES

Monthly revenue by client, with a forecast that rolls three months forward.

INPUTS AND CALCULATIONS

Columns B to D are typed in. Everything else is a formula.

- 1 The total in F42 sums F2 to F40. Row 41 is left out.
 - 2 Column D mixes £ and plain numbers in 14 rows.
 - 3 H17 is typed as 0.85. Every other row uses the rate on the Inputs tab.
 - 4 The tab called Old forecast still feeds cell C6.
-
